

IL PROGETTO

Prison inmates strongly lack the opportunity to activate and employ their own analytical thinking skills. METHESIS 2.0 aims to tackle this problem, while also attempting to overcome the strict segregation of prison population (inmates, guards, social workers).

The project explores the potential of STEM education and particularly physics in generating empowerment and fostering a crosscutting network of relationships between prisoners and operators. The proposed activities are focused on the observation and conceptualization of reality, and the creation of a laboratory that is self-sustaining from a financial and human point of view.

PARTNERS

San Vittore "F. Di Cataldo" Prison (Milan)
